Health effects of lead poisoning
Lead interferes with the development and functioning of almost all body organs, particularly the kidneys, red blood cells, and the central nervous system.

Lead poisoning is much more serious when children are exposed to lead, since their bodies are not fully developed. Lead poisoning can cause:

- Restlessness
- Hearing loss
- Loss of IQ
- Learning or behavior problems
- Developmental delays
- Brain, liver, and kidney damage

Because the symptoms of lead poisoning are similar to those of flu or viruses, the only way to know if a child is poisoned is to have a doctor perform a simple blood test.

For more information about the health effects of exposure to lead, call 1-888-242-1100 or visit:

Finding hazards from outside
Lead dust can come in from outside the home. Contaminated dust or soil can be tracked in on shoes, animals, or the wind. Soil can be contaminated from:
- Deteriorated lead-based paint around the perimeter drip line of the house
- Leaded additives in gasoline
- Industrial sources
- Demolition and paint removal from surrounding buildings

Lead can be brought home from work
Some examples include:
- Sanding, scraping or blasting lead-based paint
- Contractors who renovate/repair older homes
- Foundry workers and metal recyclers
- Making ammunition, firing guns, or working at a shooting range

Reduce the risk of lead hazards by:
- Not letting children or pets play in bare soil around perimeter of house
- Bare soil should be covered with grass, mulch, gravel, sand or other landscaping materials
- Put out doormats and remove shoes to not track lead dust into the home
- Maintaining good housekeeping
- Not wearing your work clothes home if you work with lead
- Wash your hands often

Cleaning up lead dust
1. Correct lead hazards before starting any dust cleanup to prevent further contamination.
2. While wearing rubber or disposable latex gloves, use paper towels and an all-purpose cleaner to wet-wipe all horizontal surfaces, changing towels as necessary.
3. Floors should be cleaned using the same procedure as stated above, but using a Swiffer-type handle and changing the disposable towels on the head as necessary.
4. Place all contaminated paper towels in a plastic bag immediately after use and deposit in the household trash container.

Lead dust can become so ingrained in a carpeted surface that the only way to completely decontaminate some carpeted surface areas is through removal and replacement. If disposal is not an option, use an RRP approved HEPA vacuum that is specifically designed to clean up lead contaminated dust by slowly and methodically vacuuming the carpet from one end of the room to the other. The Environmental Protection Agency (EPA) recommends after vacuuming to steam clean the carpet with a product containing sodium hexametaphosphate. Steam cleaning may need to be done more than once.
