Nebraska Title V 2015 Needs Assessment

Profile: Health needs and functional difficulties of children and youth with SHCN

Data Source: NS-CSHCN

Graphical Display of Data:

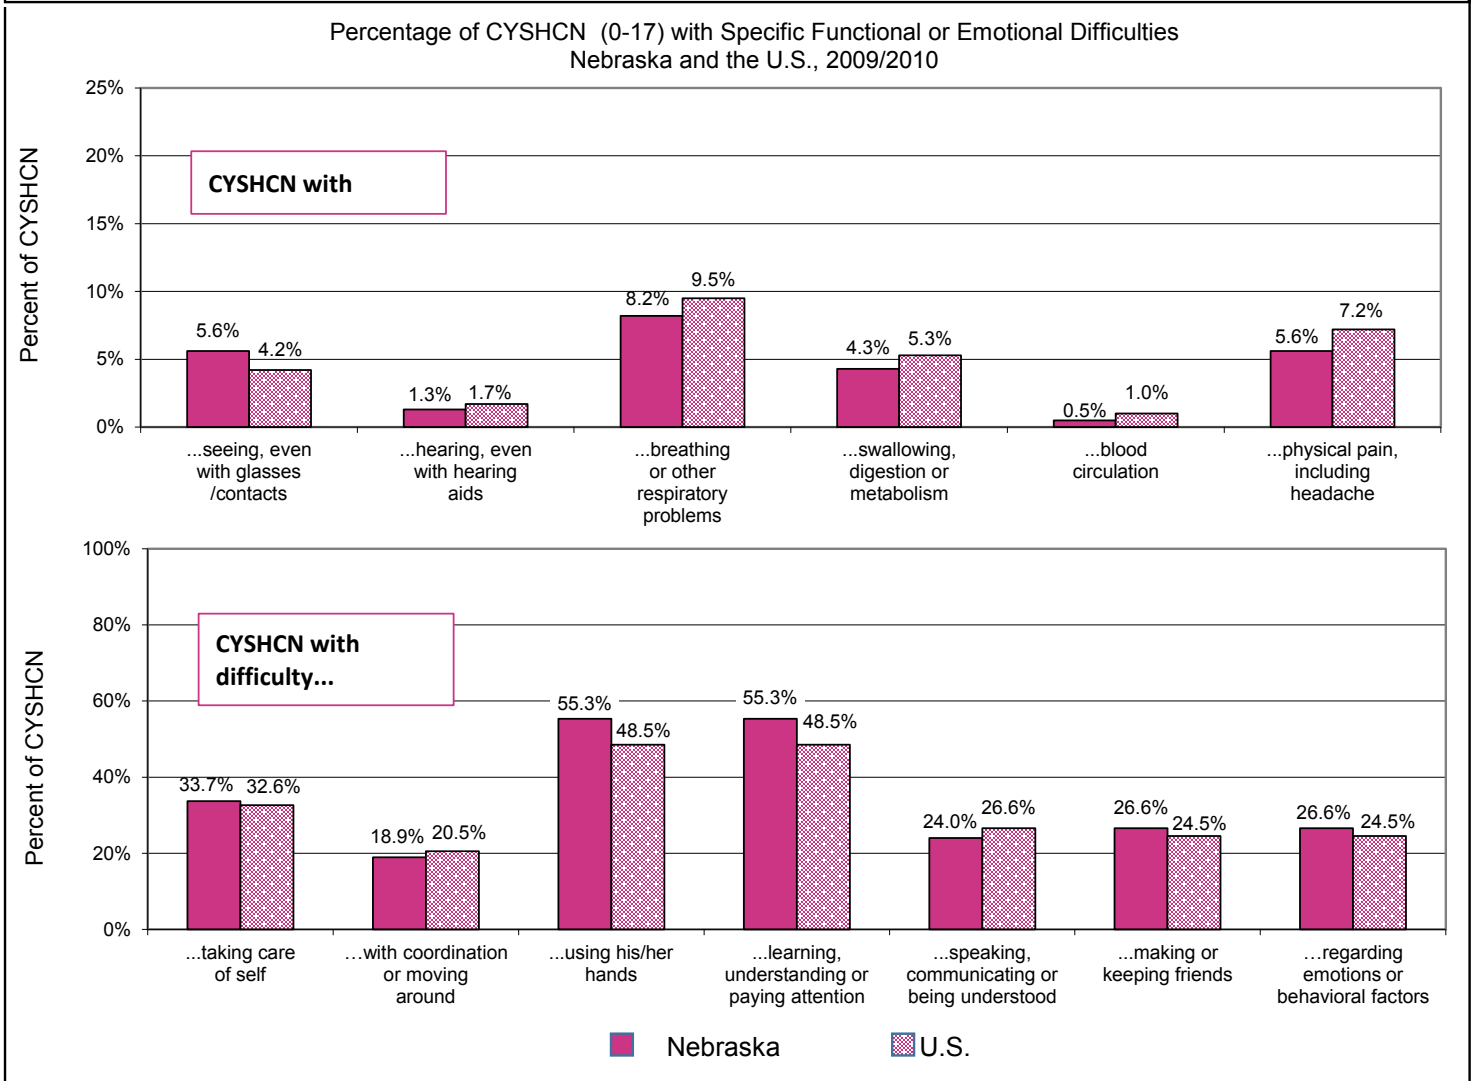

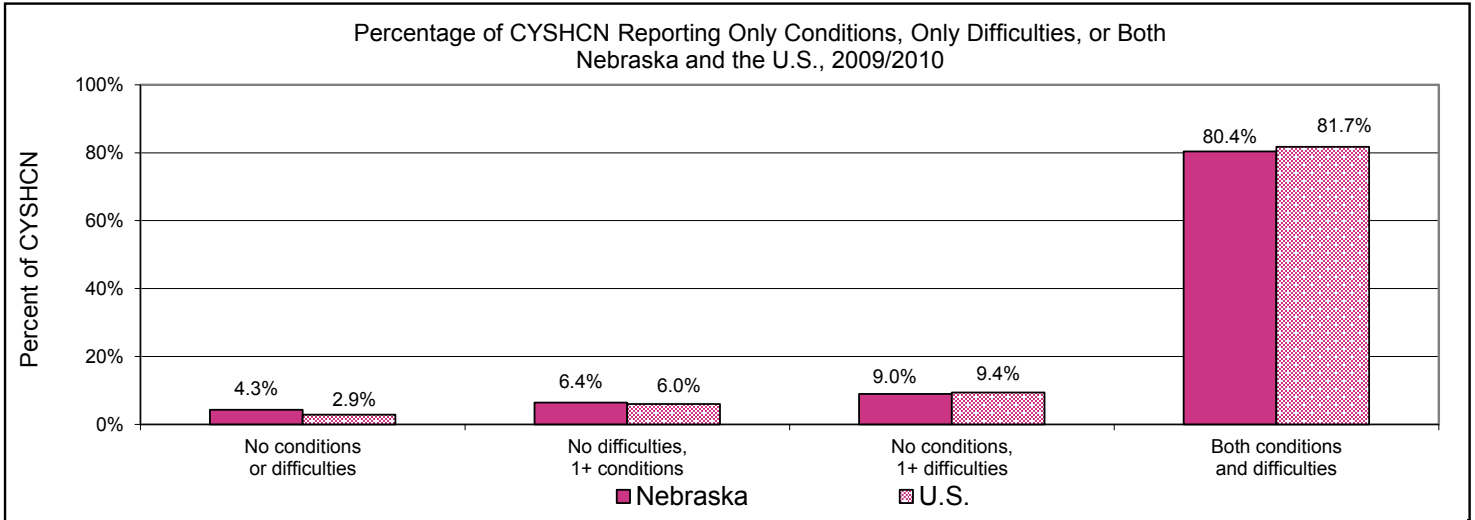

*This field stratifies children/youth according to four mutually exclusive categories, each representing specific combinations of CSHCN Screener health consequences. This measure is based on the CSHCN Screener, developed by the Child and Adolescent Health Measurement Initiative (CAHMI). The four CSHCN types are defined as follows: Rx meds only - CSHCN identified by current need for or use of prescription medication to manage an ongoing medical, behavioral, or other chronic health condition, and who qualified on no other CSHCN Screener criterion; Service use only - CSHCN who did not qualify on Rx medications or functional limitation but did qualify on one or more of three service-related screener criteria: elevated need or use of medical, mental health or educational services; need or use of specialized therapies; need for treatment or counseling for chronic emotional, behavioral, or developmental condition Rx meds AND service use - CSHCN who did not qualify on functional limitation, but did qualify based on both prescription medication use AND elevated service use (described above) Functional limitation - CSHCN qualifying on functional limitation criteria (limited ability to do things most other children the same age can do, due to the presence of an on-going medical, behavioral or other health condition) alone or in combination with any other screening criteria A detailed analysis of CSHCN subtypes has been published: Bramlett, M.D., Read, D., Bethell, C. and Blumberg, S.J. Differentiating subgroups of children with special health care needs by health status and complexity of health care needs. Maternal and Child Health Journal. 2009; 13:151-163.
