RE: Increase in Norovirus Outbreaks

DATE: April 19, 2021

Norovirus Outbreaks

Since March 1, 2021, the Nebraska Department of Health and Human Services Office of Epidemiology has received reports of 14 suspected or confirmed norovirus outbreaks among long-term care facilities, skilled nursing facilities, childcare centers, and schools. The norovirus season typically peaks from December to March, and begins to decline in April. Norovirus activity has been unusually high for this time of year, so we urge all facilities to review the document below to focus on preventing and containing the spread of norovirus in Nebraska. Any facility with two or more ill persons within 72 hours should report the suspected outbreak to their local health department (see links for map and contacts provided below).

Clinical Presentation

Norovirus is the most common cause of acute gastrointestinal disease in the United States. It is very contagious and can be contracted from an infected person, contaminated water or food, or even a contaminated surface.

Incubation period: Approximately 12 to 48 hours (median in outbreaks 33 to 36 hours); can be as short as 12 hours

Duration of illness: Typically 12 to 60 hours

Symptoms: Vomiting, non-bloody diarrhea, abdominal cramps, nausea, low grade fever (if present)

Complications: Dehydration is the most common complication

Sequelae: None known

Virus Transmission

Norovirus is spread via the fecal oral route. Infected individuals shed the virus in their stool and vomit, which can then contaminate food, surfaces, and objects. The virus spreads to others when they consume or contact the contaminated items. Virus can be shed in the stool for several weeks after recovery.
Prevention

Long-term care facilities, assisted living, and skilled nursing facilities should restrict ill residents from leaving their room until 48 hours after their symptoms resolve to reduce the risk of further spread (unless it is for essential care or treatment). Consider suspending group activities for the duration of the outbreak. Exclude ill staff, especially those with patient care and food handling responsibilities, until 48 hours after symptoms resolve to help reduce further spread. Staff who work at multiple healthcare facilities should eliminate or minimize inter-facility movement during the duration of the outbreak. Additionally, enforcing exclusion policies for visitors will help prevent further spread.

Childcare centers and schools should educate staff and children on proper hand hygiene. Facilities should assist younger children with washing their hands after using the toilet and before eating. Any staff, childcare attendee, or student with symptoms of norovirus infection should be sent home and not return until 48 hours after symptoms resolve to help prevent further spread.

Environmental surfaces should be disinfected using a chlorine bleach solution with a concentration of 1,000-5,000 ppm (5-25 tablespoons of household bleach [5-8 %] per gallon of water) or other disinfectants effective against norovirus (https://www.epa.gov/pesticide-registration/list-g-epa-registered-hospital-disinfectants-effective-against-norovirus).

The following general recommendations from the Centers for Disease Control and Prevention (CDC) can help prevent outbreaks from occurring:

- Practice proper hand hygiene: wash hands carefully with soap and water especially after using the toilet and changing diapers, and always before eating, preparing, or handling food. You can use alcohol-based hand sanitizers in addition to hand washing, but you should not use hand sanitizer as a substitute for washing your hands with soap and water. Hand sanitizers aren’t as effective as washing hands with soap and water at removing norovirus particles.

- Clean and disinfect surfaces: Check the labels on your cleaning products to ensure they are effective against norovirus. Clean up vomitus and diarrheal incidents immediately using the appropriate Personal Protective Equipment (PPE), including gloves and a protective gown. Immediately remove and wash soiled clothes or linens that may be contaminated with vomit or feces using rubber or disposable gloves. Wash the items with detergent and hot water at the maximum cycle length and machine dry them at the highest heat setting.

- Exclude sick staff and children: All ill staff and children should be sent home from the facility for at least 48 hours after symptoms resolve. Persons with symptoms of norovirus infection should avoid food preparation and serving while sick and for at least 2 days following resolution of symptoms. Keep sick infants and children out of areas where food is being handled and prepared.

Reporting Norovirus Outbreaks

Any facility with two or more suspected norovirus ill persons within 72 hours should report the suspected outbreak to their local health department:

Map of local health departments by county and List of local health department contacts.

When reporting to your local health department, please report the following information:

- Name and setting of your facility
- First ill date (onset of symptoms for first case-patient)
- Symptoms (diarrhea, vomiting, etc.)
- Illness duration (example: illness resolves within 24 hours)
- Number of people showing symptoms (estimated at the time of initial report)
- Suspected mode of transmission (example: person-to-person)
